ABSTRACT

Title : CAR RENTAL MANAGEMENT SYSTEM

The Car Rental System is a Java-based application designed to facilitate process of renting and returning cars. It provides a user friendly interface for customers to browse available cars, filter cars based on specific criteria.

The Car Rental System consists of the following main components.

Car class:

It represents all the features of the car and details of the cars so that the user can select their choice based on requirements.

CarRentalSystem class:

It manages the car inventory and rental operations like it displays available cars, the customers can rent a car and return the car etc.

CarRentalManagement class:

 This is the main class that interacts with users through a command-line interface. It creates an instance of car rental system class and provides a menu-driven interface for the user to perform various operations.
